

Traffic Analytics Dashboard – Business Report

Dashboard Overview

This dashboard integrates multiple traffic indicators to understand congestion, speed, and traffic volume patterns for better urban traffic management.

Summary of Findings

Traffic volume shows a wide spread indicating varying demand across roads. Higher traffic volume consistently leads to lower average speed and higher congestion.

Key Insights

1. High traffic volume strongly correlates with congestion.
2. Average speed decreases as congestion increases.
3. Congestion levels show extreme outliers indicating critical bottlenecks.
4. Some roads consistently experience high congestion regardless of volume.

Business Recommendations

- Optimize traffic signals in high-volume zones.
- Promote public transport during peak hours.
- Schedule roadwork during low-traffic periods.
- Use traffic volume as an early congestion predictor.

Final Story with Dashboard

The dashboard tells a clear story: increasing traffic demand leads to congestion, reduced speed, and inefficiency. By monitoring these metrics together, decision-makers can proactively manage traffic and improve commuter experience.
